Detailed Description Text - DETX (8):

A similar test was made in vivo, using a Rhesus monkey, with control and trial bicuspid and molars treated, as above, and remaining in vivo for one month during which time the monkey drank, ad lib., a water supply containing 0.25 percent fluorescein. Following extraction the two groups of teeth were treated, as above, and both with magnification under ultraviolet light and following X-ray filming the control teeth showed substantial marginal leakage and the trial or treated teeth no marginal leakage. Other trials, as above, have yielded consistent results.

Brief Summary Text - BSTX (143):

Three to four drops of stain (fluorescein sodium, 0.75 weight percent in buffered glycerol) were placed in the mouth in the back region of the lower front teeth of an adult male subject. The stain was mixed with saliva, swished in the mouth a few times, followed by expectoration. The mouth was then rinsed twice with water. A Plaq-Lite was turned on and focused on the teeth. (The Plaq-Lite is a source of ultra-violet light). Substantial plaque formation on the subject's teeth was observed as evidenced by the glowing yellow color. After this, approximately 0.5 ounce of the Final Solution described in Example 2 supra was placed in the subject's mouth, swished a few times, followed by
